

Programming without a programming device

Servo processing modules and VariControl control system

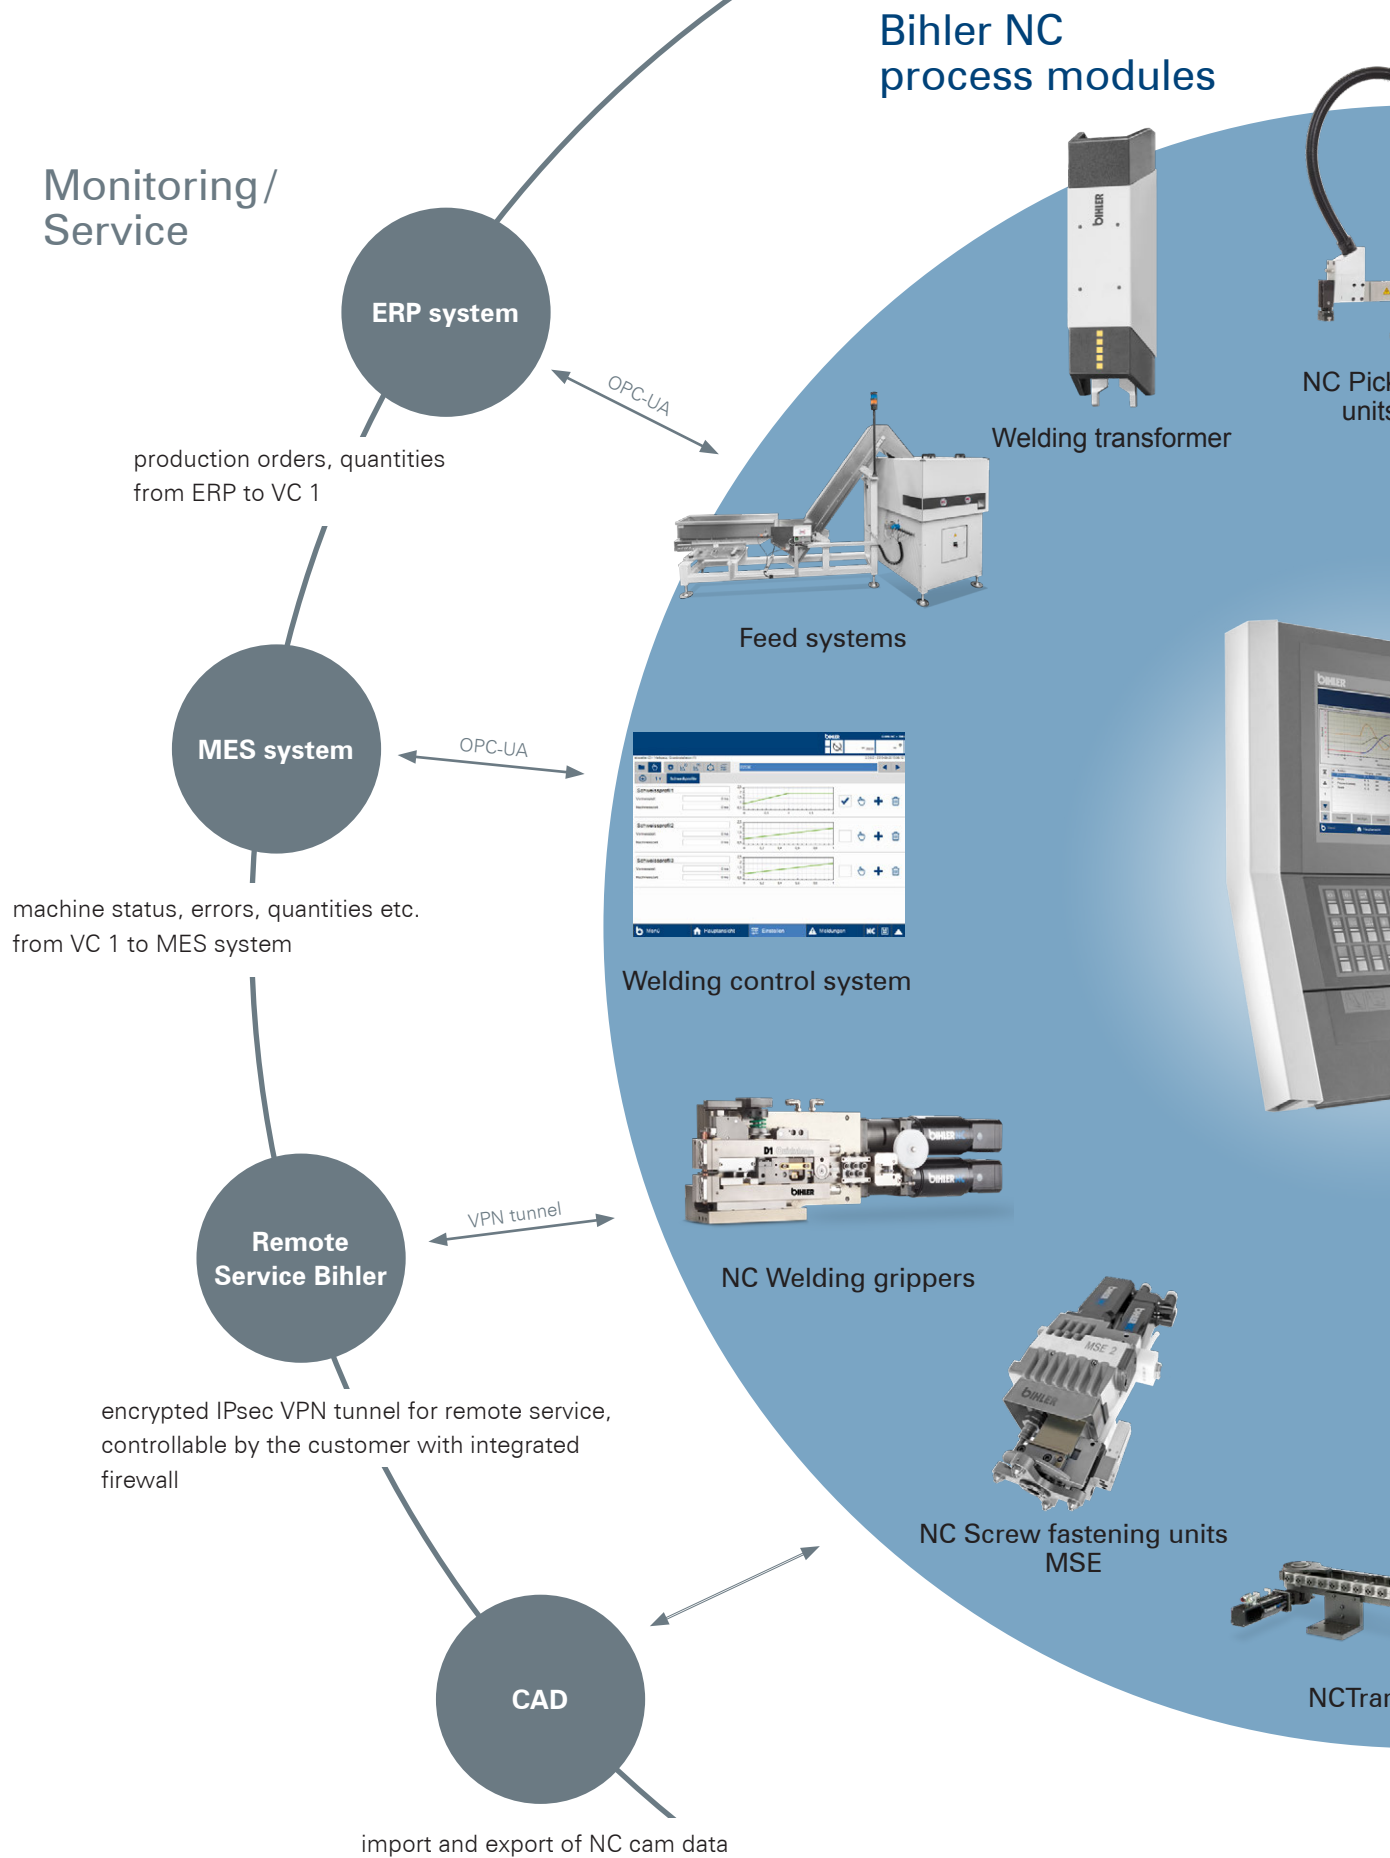

The intuitive way to your automation solution

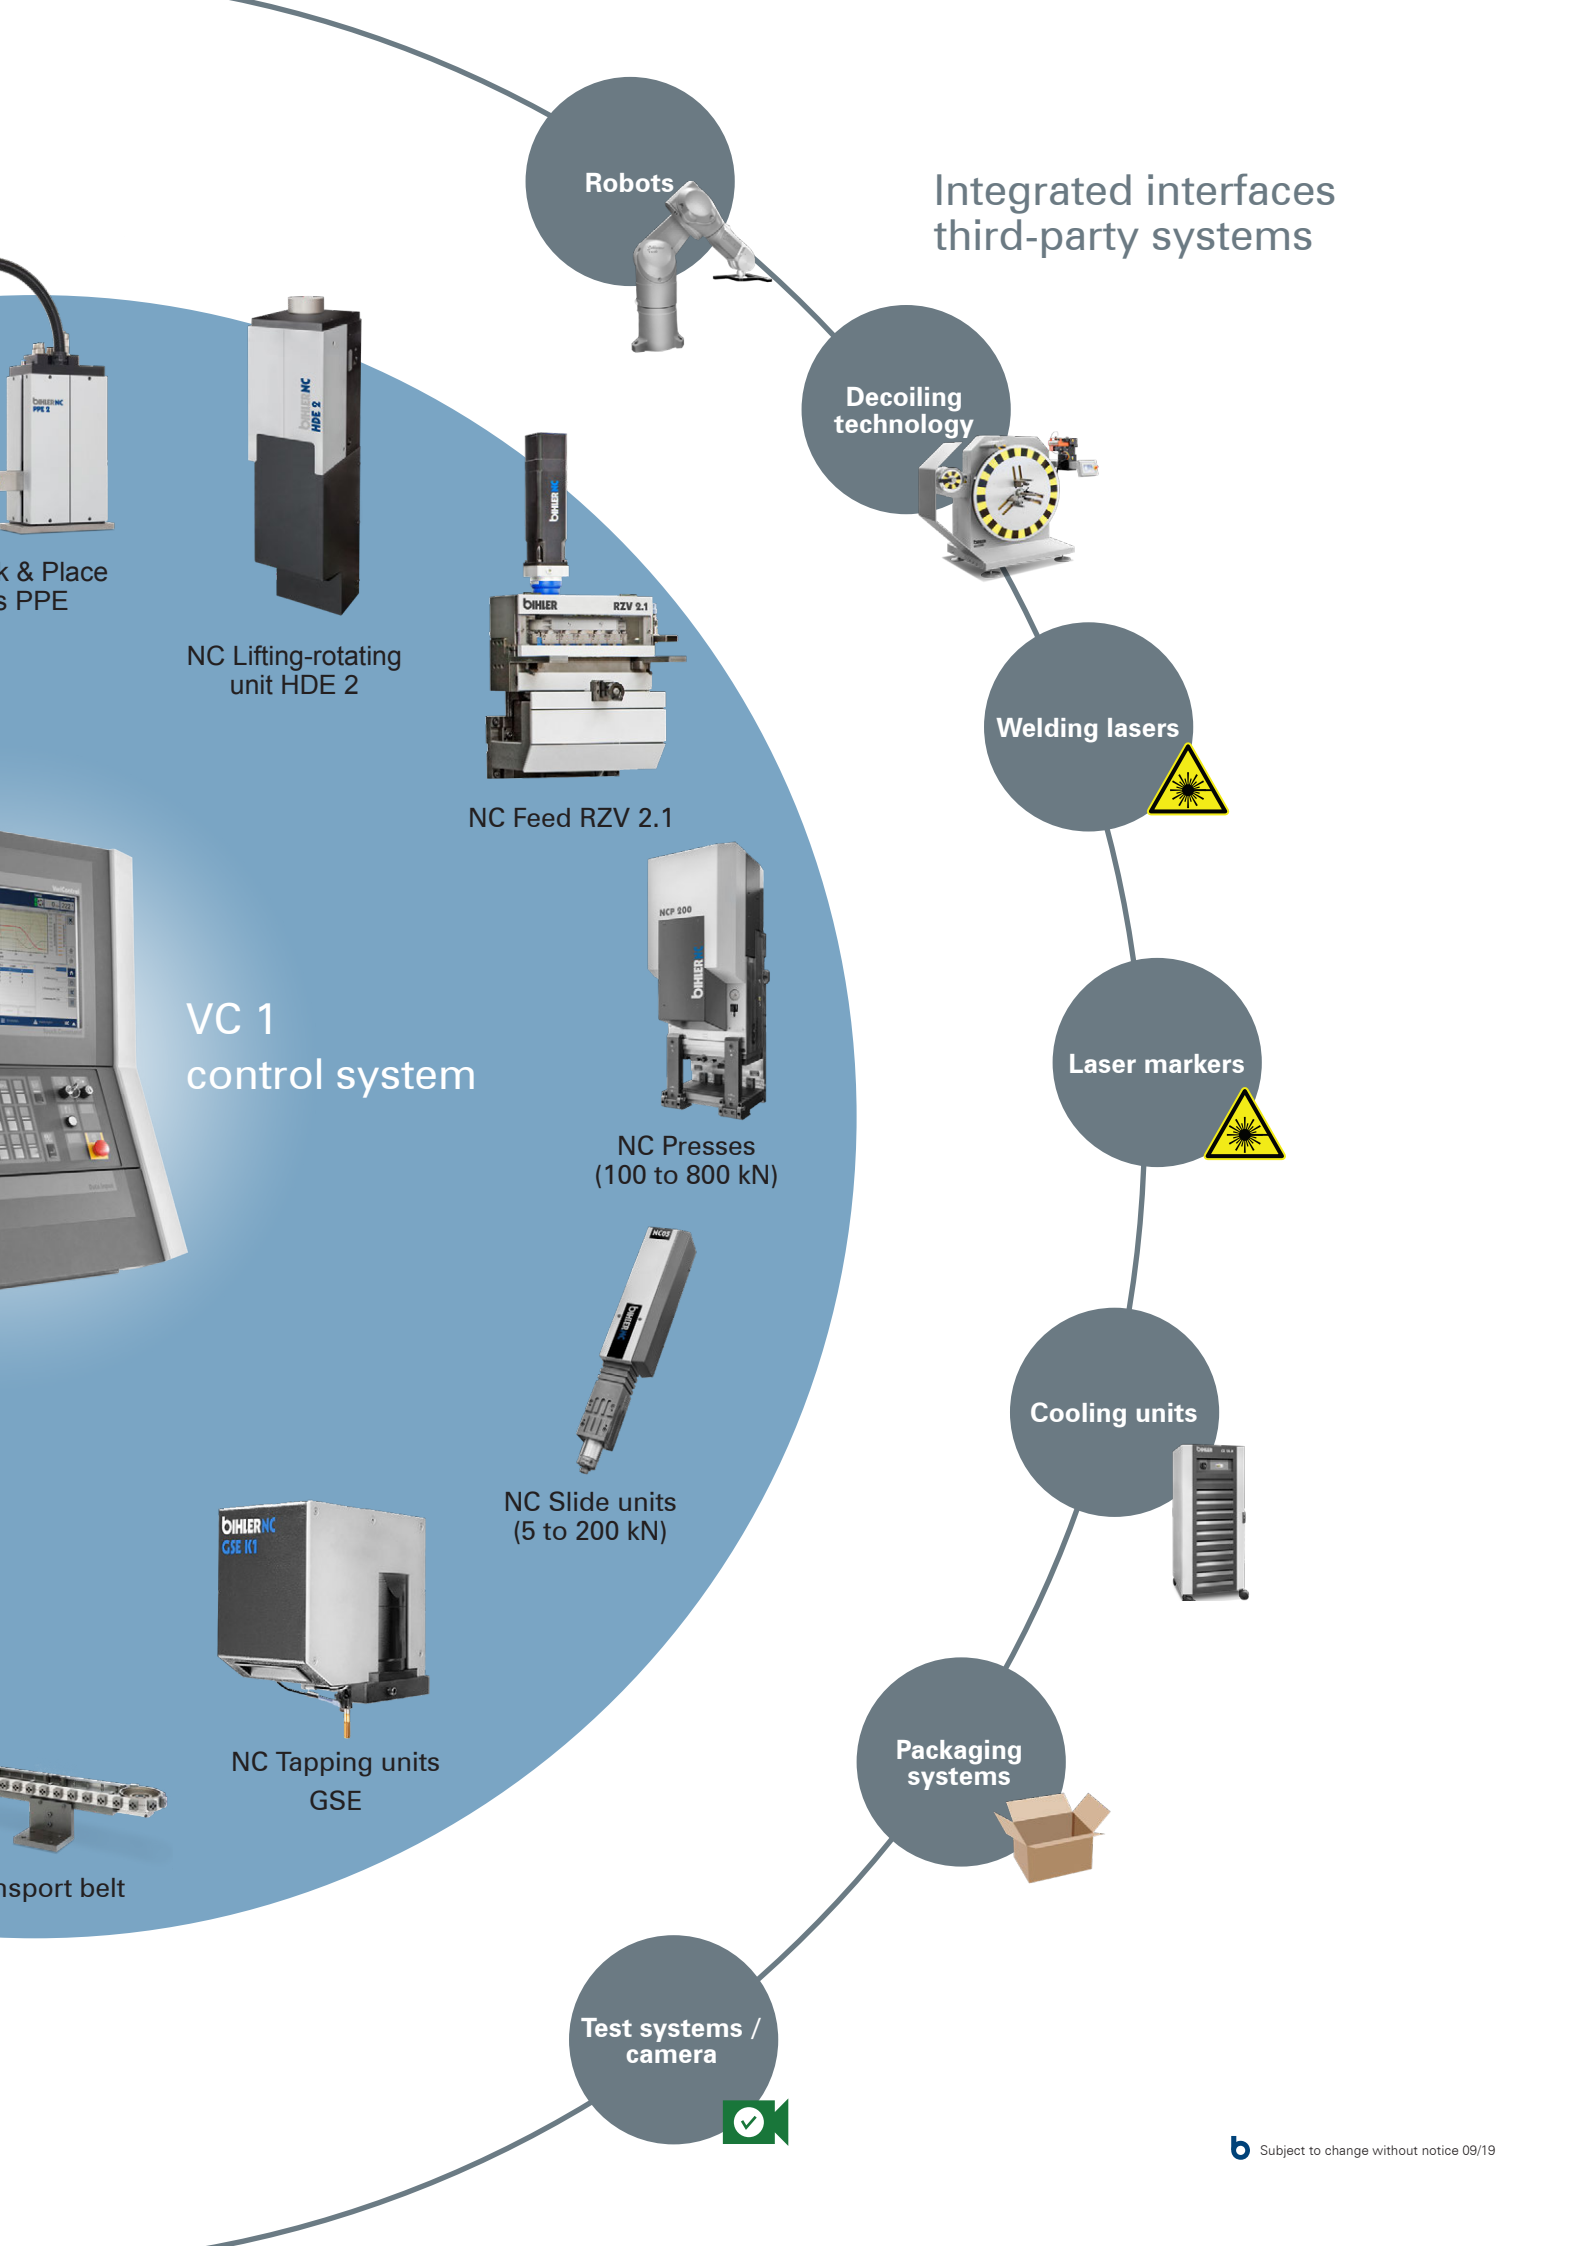

Benefit from our expertise in servo technology. For all production, assembly and machining tasks, we offer high performance, dynamic and precision NC process modules. The VariControl is the central control system for all these mechatronic Bihler modules. Corresponding interfaces are also integrated for intelligent third-party systems in the VC 1.

You can create your application quickly and easily by programming directly on the VC 1 control system. You do not need a separate programming device. A complete Bihler solution is also possible at any time. We provide the design of mechatronics and control system for you and support you in application programming, design and manufacturing of the electrical switchgear.
